

PATENT

**PENDING CLAIMS AS AMENDED**

Please amend the claims as follows:

1. (Original) In a wireless communication system having a rake receiver with multiple fingers, a method comprising:  
determining a lock state for a first finger of the multiple fingers;  
determining a comparison of received signal energy for the first finger to a threshold value if the first finger is out of lock; and  
adjusting a lock filter for processing signals received on the first finger in response to the comparison.
2. (Original) The method as in claim 1, further comprising:  
waiting a first time period if the first finger is out of lock before adjusting the lock filter.
3. (Original) The method of claim 1, wherein adjusting the lock filter further comprises:  
providing an output of the lock filter equal to the received signal when the energy of the received signal is greater than the threshold; and  
increasing an energy level of the lock filter when the energy of the received signal is less than the threshold.
4. (Original) The method of claim 1, further comprising:  
determining a comparison of filtered signal energy for the first finger to a second threshold after adjusting the lock filter; and  
reassigning a path to the first finger in response to the comparison.
5. (Original) The method of claim 4, further comprising:  
maintaining path assignments to the multiple fingers for a predetermined time period.
6. (Original) The method of claim 1, further comprising:

PATENT

determining if a transmitter of the received signal is in soft hand off; and  
providing power control instructions as a function of the energy of the received signal if  
the transmitter is in soft hand off.

7. (Original) The wireless apparatus performing the method of claim 5, further comprising:  
instructing the transmitter to gradually adjust transmit power.
8. (Original) A transceiver, comprising:  
a rake receiver having a plurality of fingers, the plurality of fingers adapted to receive  
multipath signals; and  
a lock detector coupled to the rake receiver operative to adjust signal filtering based on  
lock states of the fingers.
9. (Original) The transceiver of claim 7, wherein the lock detector is further operative to  
compare received energy of the received signal to a first energy threshold.
10. (Original) The transceiver of claim 8, wherein the lock detector comprises:  
a lock filter operative to filter the received signal; and  
a filter adjustment means operative to adjust the lock filter in response to the lock  
detector.
11. (Original) The transceiver of claim 9, wherein the filter adjustment means waits a  
predetermined time period prior to adjusting the lock filter.
12. (Withdrawn) A method for tracking a mobile station in a wireless communication  
system, comprising:  
determining if the mobile station is in soft hand-off;  
ignoring a lock state of a rake antenna if the mobile station is in soft hand-off; and  
transmitting a predetermined power control pattern if the mobile station is not in soft  
hand-off.

PATENT

13. (Withdrawn) The method of claim 12, further comprising:  
adjusting the power control as a function of received signal energy if the mobile station is  
in soft hand-off.
  
14. (Original) A wireless apparatus, comprising:  
filter means to filter a received signal from a first propagation path;  
comparison means operative to compare the received signal to a threshold value;  
filter adjustment operative to adjust the filter means in response to the comparison means.
